## Saturated fusion systems as stable retracts of groups

on September 28 at 4:30 in MIT Room 2-131

A saturated fusion system associated to a finite group G encodes the p-structure of the group as the Sylow p-subgroup enriched with additional conjugation. The fusion system contains just the right amount of algebraic information to for instance reconstruct the p-completion of BG, but not BG itself. Abstract saturated fusion systems F without ambient groups exist, and these have (p-completed) classifying spaces BF as well. In spectra, the suspension spectrum of BF becomes a retract of the suspension spectrum of BS, for the Sylow p-subgroup S, so BF gets encoded as a characteristic idempotent in the double Burnside ring of S. This way of looking as fusion systems as stable retracts of their Sylow p-subgroups is a very useful tool for generalizing theorems from groups or p-groups to saturated fusion systems. In joint work with Tomer Schlank and Nat Stapleton, we use this retract approach to do Hopkins-Kuhn-Ravenel character theory for all saturated fusion systems by building on the theorems for finite p-groups.
